Explaining Python Data Structures using Examples from

SWIGGY

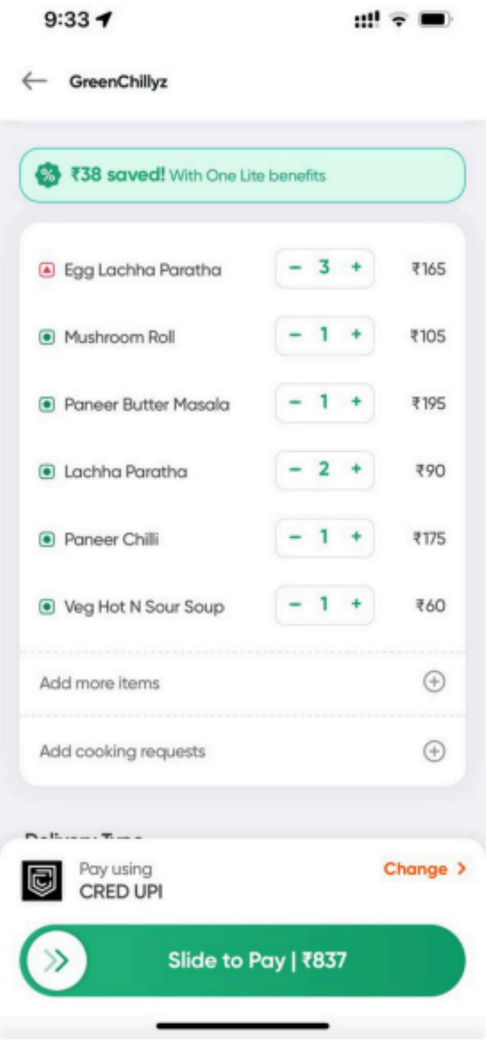
Lists

SWIGGY

Cart Items

In Python, a list is an ordered, mutable collection that can store multiple items.

On Swiggy, the items in your cart represent a list; the cart contains an ordered list of dishes that a user might purchase. User can add, remove, or rearrange the order of items in the cart which shows mutability and order in Python list.



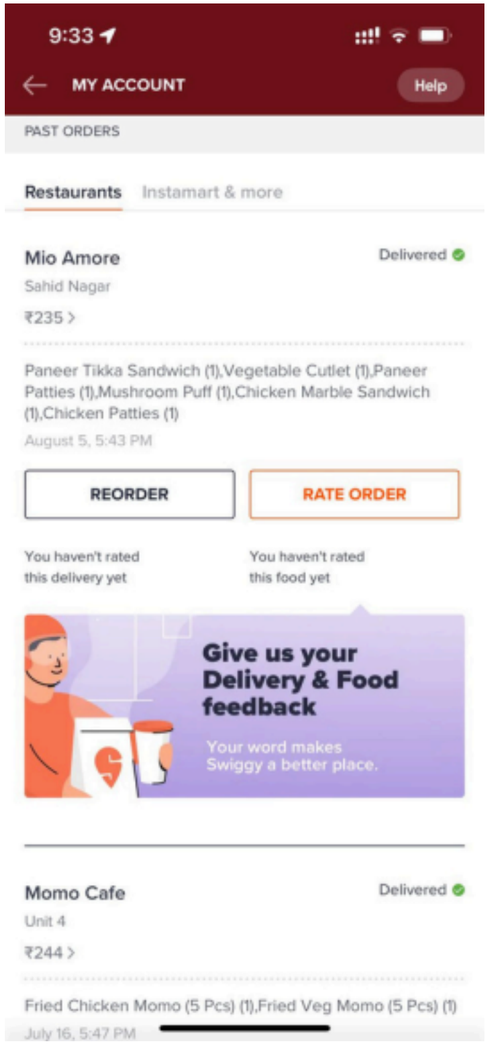
Tuples

SWIGGY

Past Orders

In Python a tuple is an immutable ordered collection.

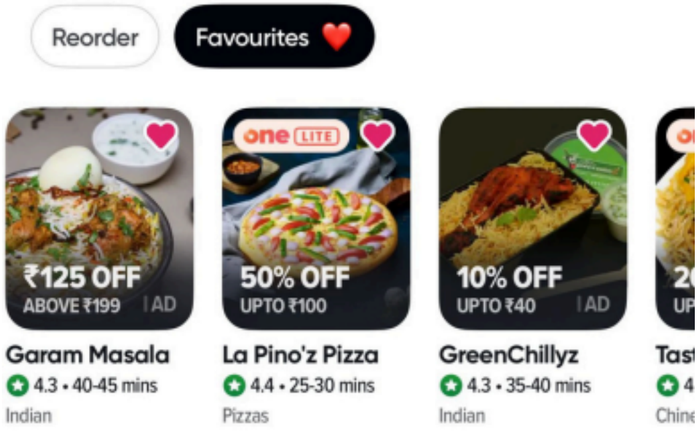
On Swiggy the order history represents a tuple - each past ordered item is recorded in the exact sequence it was placed and can not be changed once done. Which shows immutability and order of a python tuple.



Sets

SWIGGY

Favourites



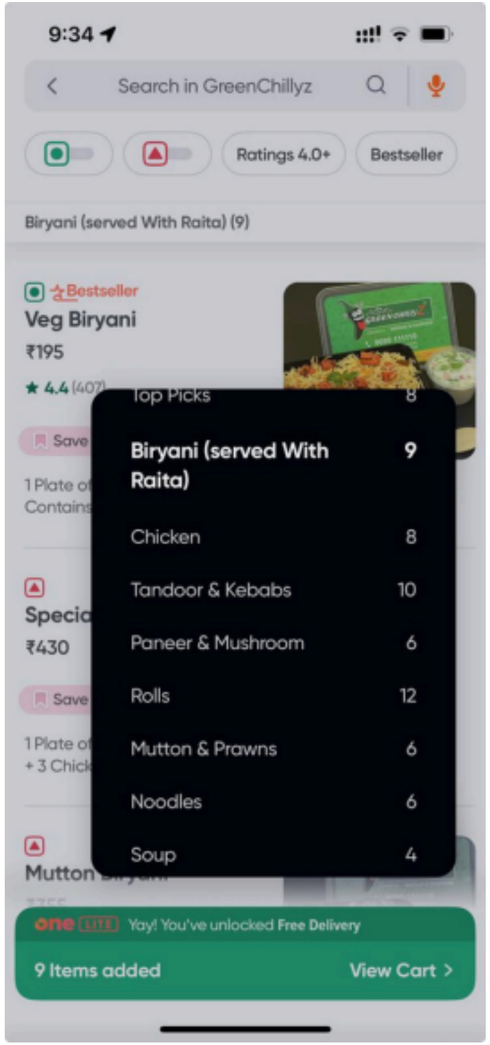
Set is an unordered collection of different items.

On Swiggy the favourite section represents a set. Here you can add your favourite restaurants, and each restaurants only appears once in this section. The order doesn't matter, no duplicates are allowed mirrorizing how sets work in Python

Dictionaries

SWIGGY

Restaurant Menu

A dictionary in Python is a collection of key-value pairs.


In Swiggy, the restaurant menu can be seen as a dictionary where the keys are the categories (e.g., Starters, Main Course, Desserts) and the values are lists of dishes under each category. This structure allows users to quickly navigate through the menu, just as a Python dictionary allows for quick access to values based on their keys.
